

# Newton Packages

You can install these packages on your Newton device. You may find them useful, but they are not required for the operation of NCX.

## Connection additions

These packages add options to the 'Connect via:' menu in the Connection app.

### **Dock\_TCP-1.2-de.newtonpkg**

### **Dock\_TCP-1.2-en.newtonpkg**

This package (localized for German and English) adds a TCP/IP option for connection to NCX over ethernet. The Newton Internet Enabler (NIE) must already be installed and configured.

### **EthernetDock.newtonpkg**

This package replaces the AppleTalk option with Ethernet. This is an alternative to the TCP/IP extension above. Again, NIE must already be installed and configured. To restore the AppleTalk option, freeze or delete the EthernetDock extension.

### **Ser115200.newtonpkg**

This package adds a Serial 115200 option for serial connection at that speed. You will need to set the same serial speed on the Mac side if you choose this option.

## Enhancements

### **NamesURLs.newtonpkg**

This package adds a URL field to a Names entry, corresponding to the URL field in a Mac OS Address Book entry.
