

Newton Connection for Mac OS X

NCX version 2.3, build 60

This file contains information about this release. For an overview of NCX 2 refer to the [Newton Connection website](#). For operating instructions refer to the application help.

What's New

The source list is updated during backup. (Not technically new: this feature unaccountably disappeared in the previous version.)

Improvements to the simulated internal flash store.

Known Problems

If NCX crashes on launch, it may be because its simulated internal flash store has become corrupted. Delete the file at `~/Library/Application Support/Newton/Internal`.

The Ethernet connection option in the Newton Dock application (provided by the `Ethernet.newtonpkg`) assumes you have a default NIE link which you must have previously established. If this is not the case, use the TCP/IP option (provided by `Dock_TCP-1.2-en.newtonpkg`).

An ethernet connection will often fail (with error -4) when browsing files from the Newton device. The workaround - don't browse files from your Newton device when using an ethernet connection!

Feedback

Please report any bugs, unexpected behaviour or feature requests to [<simon@newtonresearch.org>](mailto:simon@newtonresearch.org) or by using the Report Bugs application menu item in NCX.
